DMON Soundfile Splitting and Renaming Guide

Last Updated: March 2025

This program allows you to rename your .wav files to include the soundfile start date/time in the file name. It will also automatically split any concatenated soundfiles from duty cycled recordings into individual .wav files. The renaming feature will work on continuous recordings as well. To run this program, you will need a Mac or Windows computer with an IDL 9.0 runtime license.

1. Download the reformat_dmon_wav_files.sav file.

2. Double click on the .sav file icon and your IDL runtime license will start automatically and launch the program.

3. When the program launches, you will be prompted to identify the folder where all the DMON data are (i.e., the .xml, .log, and .wav files), and a folder where you would like to save the renamed wav files. If you want to change the input or output folders you just chose, there are buttons on the graphical user interface for that. Once you have selected the folders you want, click the "Go!" button, and the reformatting will commence.

   If for any reason you need to interrupt the processing, click the "Halt" button. If you want to exit while processing, click the "Halt" button and then the "Exit" button.

4. When the processing is done, click the "Exit" button.

5. If you want to save what is printed in the window to a file, click the "Save Display" button and the file will be saved in the same folder that you launched the program from.

Note from Josh: This works for both HF and LF wav files. Make sure to leave the file endings as .wav2 or .wav3 if doing this, and put xml and log files in the same folder as these files.

sAll filenames will have date/time stamps in the following format: *_YYYYMMDDhhmmss_uuuuuu.wav
where YYYY is year, MM is month, DD is day, hh is hour, mm is minute, ss is second and uuuuuu is the number of microseconds after the second
